Attitudinal Survey on Hand-Held Electronic Devices

Louisiana Drivers

ABOUT THE POLL

Louisiana Survey on the Use of Hand-held Electronic Devices while Driving, 2009

This poll was developed and conducted by Applied Technology Research Corporation for the Louisiana Highway Safety Commission. The poll was designed to address Louisiana licensed motorists' practices and opinions on the issue of hand-held, electronic devices while driving and on possible legislation related to the use of such devices while driving.

The sample design provided for interviewing 800 licensed motorists statewide. Interviews were completed by telephone with a total of 800 licensed motorists from Thursday, November 12 through Sunday, November 15, 2009.

The overall margin of error for the statistics obtained from the survey data in the sample of 800 licensed motorists is not greater than plus or minus 3.5 percentage points at the 95% level of confidence. In other words, there is a 95% certainty that the statistics presented for the results obtained on this survey are not more than 3.5 percentage points above or below the figure that would have been obtained if all of the licensed motorists in the state would have been interviewed.

The sample error may be larger for subgroup responses, such as those based on respondents by education, age, and other demographic or attitudinal variables. There are other sources of potential error which cannot be calculated including question wording and order of question presentation.

A random digit dialing (RDD) procedure was used to generate telephone numbers.

Respondents were assigned to one of nine Louisiana State Police Troops based on their parish of residence.

Quotas were imposed to ensure nominal male participation and representation by age category in the study. A statistical weighting procedure was applied to normalize the sample to the actual population based on age and sex. The percentages shown in the tables are weighted. Counts within tables are unweighted counts. The count of cases used in computation of subset statistics (using the format $n=xxx$) presented under the relevant crosstabulation tables are unweighted counts of cases used to generate the statistics in those tables.
